GSM ADAPTER INFORMATION

* without warranty of technical functions

Adapter or Firmware information can be changed without notice.

Depending on your local contract limitations.

Important:

Make always sure that you are in your GSM Network, in case of Roaming big cost may arise! You can see the providers information by pressing "Status" on your GY-HM650 - but if you are in a country boarder area it could change quickly !
On some Provider tool softwares you can hide roaming, but always make sure: we are not responsible for this costs, or malfunction of the data storage in the Adapter!

GSM ADAPTERS which can be used (please note the information above, regarding Contract and Firmware issues)

Important !!										
Country	Provider	USB Dongle type Product type	USB Hardware CHIP SET	Type of connection	Camera Identification as ..	Dial-in	User	Password	additional Information	Internal code

ANY	Vodafone		K5006							
	ALL	which have a ZTE Chipset!								

Technical Notes: please take care of it!

GSM Adapters must be integrated from JVC side at first before they can be used.
If a GSM Adapter is identified by the camcorder, you need to take of the dial-in numbers and user and passwords in your countries.

What you need to do at first ?

Take the Adapter into your PC or Laptop before you try to use them in the camcorder !
With the Software you got the Adapter you need to make the SIM Card PIN log free - so please use the Providers Utility Software to remove the PIN code request ! (otherwise you are not able to use the Adapter later in the camcorder !)
If this is done please make a full connection on your Laptop to the internet, this stores the APN information in your Adapter.

If you connect the adapter into the camcorder now, please add the dial-in number normally *99# or *99**1# ,
use the user and password logs which you got from the provider - as long is it not mentioned in the list above !

If your set-up is done - please give the camcorder a time to log in - ~ upto 1 minute.

It could be possible that you need to switch off and restart the camcorder.

If you have any problems, then please contact us.

What to do when non of the adapters in my countries can be used ?

If non of the adapter can't be used but you have a GSM Internet, you can use your smartphone.

In the setting of such device you can find a mode called "tethering" - this changes your phone as an access point,
the mobile phone makes the internet connection and you can access it with a WIFI dongle from the camcorder to the Smartphone !
Also there are small WIFI GSM adapters in the market, which you can easily transport in your pocket. This adapters can be used to make a WIFI bridge to the GSM.
But note: Depending on such Hardwares or Contracts Internet operation can be limited, please ask your provider if FTP or Streaming is available!

Using WIFI could have some limitation too, depending on the environment and network situations around you.

Please download also our WIFI Dongle list.
